Lecture 32 (11/12)**12 Introduction to Rings****12.1 Motivation & Definition****Definition 1 (Ring)**

A ring R is a set with two binary operations: $a + b$ and $a \cdot b = ab$ such that for all $a, b, c \in R$,

1. $a + b = b + a$
2. $(a + b) + c = a + (b + c)$
3. \exists an additive identity 0 , $a + 0 = a$
4. \exists an element $-a \in R$ such that $a + (-a) = 0$
5. $(ab)c = a(bc)$
6. $a(b + c) = ab + ac$
 $(b + c)a = ba + ca$

So a ring is an abelian group under addition, and also has an associative multiplication that is left and right distributive over addition.

- The multiplication need not be commutative. When it is, we say the ring is commutative.
- A unity (or identity): a nonzero element that is an identity under multiplication.
- unit: a nonzero element of a commutative ring with identity that has a multiplicative inverse.
- In R , $a \mid b$ if $\exists c \in R$ such that $b = ac$.
- $n \in \mathbb{Z}_{>0}$, $na = \underbrace{a + a + \cdots + a}_{n \text{ times}}$

12.2 Examples of Rings**Example 1**

$(\mathbb{Z}, + \times)$ is a commutative ring with identity and units $= \pm 1$

Example 2

$(\mathbb{Z}_n, + \times)$ is a commutative ring with identity and units $= U(n)$

Example 3

$(\mathbb{Z}[x], + \times)$ is a commutative ring with identity

Example 4

$(\mathbb{M}_2[\mathbb{Z}], + \times)$ is a non-commutative ring with identity

Example 5

$(2\mathbb{Z} = \{\text{even integers}\}, + \times)$ is a comm ring without identity

Example 6

({continuous functions on \mathbb{R} , $+\times$ }) is a comm ring with identity $f(x) = 1$

Example 7

({continuous functions on \mathbb{R} whose graphs pass through $(1, 0)$, $+\times$ }) is a comm ring without identity

Note $f(1) = 0$, $g(1) = 0$, $f + g, fg$

Definition 2 (Direct sum of rings)

Let R_1, R_2, \dots, R_n be rings. Construct

$$R_1 \oplus R_2 \oplus \dots \oplus R_n = \{(r_1, r_2, \dots, r_n) \mid r_i \in R_i\}$$

endowed with component-wise addition and multiplication. This is called the direct sum of R_1, R_2, \dots, R_n .

12.3 Properties of Rings**Theorem 12.1** (Rules of Multiplication)

For all $a, b, c \in R$,

1. $a \cdot 0 = 0 \cdot a = 0$
2. $a(-b) = (-a)b = -(ab)$
3. $(-a)(-b) = ab$
4. $a(b - c) = ab - ac$
 $(b - c)a = ba - ca$
5. $(-1)a = -a$
6. $(-1)(-1) = 1$

Note 1

Properties 5 and 6 only hold if R has an identity 1

Proof of property 1. Clearly $0 + a0 = a0 = a(0 + 0) = a0 + a0$, so by cancellation $0 = a0$ and similarly $0a = 0$ \square

Theorem 12.2 (Uniqueness of the Unity and Inverses)

If a ring R has a unity, it is unique. If a ring element has a multiplicative inverse, it is unique.

Proof. $1, 1' \implies 1 = 1 \cdot 1' = 1'$

$$a \quad ab = ba = 1$$

$$ac = ca = 1$$

$$c = c \cdot 1 = c(ab) = (ca)b = 1 \cdot b = b \quad \square$$

Warning

In general, $ab = ac \not\Rightarrow b = c$ (cancellation rule does not hold in general for multiplication).

Example 8

In \mathbb{Z}_6 , notice $2 \cdot 3 = 0 = 3 \cdot 0$ but $2 \neq 0$

12.4 Subrings**Definition 3** (Subring)

A subset $S \subseteq R$ is a subring of R if S is itself a ring with the operations of R

Theorem 12.3 (Subring Test)

A nonempty subset S of a ring R is a subring if S is closed under subtraction and multiplication.

i.e. if $a, b \in S$ then $a - b \in S$ and $ab \in S$

Example 9

$\{0\}$ and R will always be subrings of any ring R .

Example 10

$\{0, 2, 4\} \subseteq \mathbb{Z}_6$ is a subring

1 is the identity in \mathbb{Z}_6

4 is the identity in $\{0, 2, 4\}$ ($0 \cdot 4 = 0$, $2 \cdot 4 = 2$, $4 \cdot 4 = 4$)

Example 11

$n\mathbb{Z} = \{0, \pm n, \pm 2n, \pm 3n, \dots\}$ is a subring of \mathbb{Z} that does not have any identity (if $n \neq 1$).
